WEB BROWSERS

SEARCH ENGINE

Many beginners on the web confuse search engines and browsers. Let's make it clear: a browser is a piece of software that retrieves and displays web pages; a search engine is a website that helps people find web pages from other websites. The confusion can arise because the first time someone launches a browser, the browser displays a search engine's homepage. This makes sense, because, obviously, the first thing you want to do with a browser is to find a web page to display.

“The browser is the thing that lets you visit any web site you want, like The Wall Street Journal or the Seahawks. Several of those sites, like Bing and Google, let you search for whatever information you are looking for. **The browser is the car and search engines are your maps.**”

Google search is well integrated with Chrome browser, while Bing search pairs with Edge browser. Signing into accounts created for Google and Microsoft help you control security and privacy while also allowing syncing across devices.
